

API Keys - Management and Security

Generate keys at Settings > API > Keys. Each project can have up to 10 active keys.

Reset your API key:

1. Log in to the dashboard.
2. Go to Settings > API > Keys.
3. Click Regenerate next to the key.
4. Copy the new key immediately - it is shown only once.
5. Update your applications with the new key.

The old key stops working within 5 minutes.

Security best practices: never commit keys to source control; use environment variables; rotate keys every 90 days; revoke unused keys promptly.
